1. Objective

Build an agent and one interactive dashboard that shows Intuitive, office by office, what the pantry costs, when each product is due for another pack, what each person holds, who has punched in, what swag is on the shelf, and which institutes produce interns who become full-time.

Phase 1 is the pantry, and it is usable on its own. Phase 2 adds assets, punches, swag, and the assistant to the same dashboard. Phase 3 adds campus drives to that same dashboard. Later phases do not create a second site or a second login.

2. Scope at a glance

Intuitive is the client. The product is internal, and this scope is written to the standard used for a client engagement: what is included, who may do it, how the numbers are calculated, and what acceptance looks like.

Phase	What is delivered
Phase 1	Offices and roles. Pantry products, purchases, monthly prices, the expected date for the next pack, and an optional receipt on each purchase.
Phase 2	The same dashboard gains assets and their history, punches from the existing biometric device, swag stock, and the assistant. An asset or swag purchase can carry an optional receipt.
Phase 3	Campus drives, the candidates from each institute, and conversion from intern to full-time.

Stock, prices, assets, punches, swag, and drives are stored against an office. They stay separate. A person who can open more than one office can switch office without leaving the dashboard. A combined total exists only as a sum across offices, for monthly spend and for institute conversion.

3. Terms

Term	Meaning in this scope
Pack	The unit Intuitive buys and counts: one pack of coffee, one pack of milk, and the same idea for every other product.
Effective day	Monday to Friday count as 1. Saturday and Sunday count as 0.2, because the office is closed and a few people still come in. The 0.2 weight is the default.
Burn rate	Packs added over the trailing three calendar months, divided by the effective days in those months. Packs added stand for packs used.
Expected date	The day the packs on hand are projected to reach the reorder level. It is calculated. Nobody types a number of days.
Monthly product price	The money spent on that product in the calendar month: each restock's packs multiplied by that restock's price per pack.
Holding	An asset or a swag item currently with a person: a laptop, a monitor, a t-shirt, a kit, or any other item issued to them.
Conversion	Interns from an institute who became full-time, divided by interns who joined from that institute. The percent is always shown with both counts.

4. Offices, people, and roles

The Super Admin adds an office by name. Each new office opens with the five pantry products and empty stock. The Super Admin then names who may work in that office.

A person record holds the name, the home office, the identifier already used by that office's biometric device, and an active flag. That is the record assignment and punch matching use. A person may hold more than one role. Someone with no role grant sees nothing.

People sign in with the company account already used for Intuitive internal tools. Roles and office grants are stored in this agent.

Action	Super Admin	Office Manager	Admin	Accounts
Add or rename an office	Yes	No	No	No
Grant a role on an office	Yes	No	No	No
Set the weekend weight and the lookback	Yes	No	No	No
Add a product, record a pantry, asset, or swag purchase, record a count, and attach an optional receipt	Yes	Yes	No	No
View spend, expected dates, and download the month	Yes	Yes	Yes	Yes
Maintain assets and swag, and assign them on screen	Yes	Yes	Yes	Yes
Use the chatbot to ask a question or assign an item. A chat assignment is saved only after the user confirms it	Yes	Yes	Yes	Yes
View punches	Yes	Yes	Yes	No
Record a campus drive and update a candidate	Yes	Yes	No	No
View institute conversion	Yes	Yes	Yes	Yes

No means the role does not take that action. The chatbot row is asking a question, or assigning an asset or swag item, in the chat. A write in the chat, such as a purchase, a count, or an assignment, is saved only after the user confirms the summary. The Super Admin, the Office Manager, Admin, and Accounts can use the chatbot for the offices they may open. They can also do the same writes on the dashboard screens. Every Yes is limited to the offices that person may open. The Super Admin can open every office. The Office Manager is the HR owner of the offices they are given. Accounts sees money, holdings, and conversion. Daily punch times stay with Super Admin, Office Manager, and Admin.

5. Phase 1: Pantry expense management

Phase 1 is the pantry for every office. It records what was bought, what it cost this month, and the expected date for the next pack. Coffee, Milk, Sugar, Tea, and Sticks are created with the office. The Office Manager can add a product, rename one, or hide one that the office does not use. Hiding a product keeps its history and removes it from new restocks.

5.1 Products and monthly prices

A pantry purchase is one line: office, product, date, number of packs, and price per pack. The Office Manager can attach a receipt to that purchase. The receipt is optional, and the purchase is saved with or without it. The person and the time are stored with the line. On-hand increases by the packs added. A physical count sets on-hand to the number on the shelf and becomes the new starting point.

Product	How it starts
Coffee	Created with every new office
Milk	Created with every new office
Sugar	Created with every new office
Tea	Created with every new office
Sticks	Created with every new office. The Office Manager can rename it.
Further products	Added by the Office Manager for that office. No code change.

- **Tracked Metrics: Packs added, price per pack, spend in the calendar month, packs on hand, burn rate, expected date, status, and the receipt when one was attached.**
- **Monthly product price:** For each product, the sum of packs × price per pack on restocks dated in that month. The office total is the sum of its products. The Super Admin also sees the sum across offices.
- **Dashboard View:** An office switcher, a month selector, and one row per product. The row shows packs added this month, spend this month, latest pack price, packs on hand, burn rate, expected date, and a status of On track, Due, or Not enough history. The month's restock lines and totals download as a spreadsheet for the office on screen.

5.2 How the expected date is worked out

Intuitive does not type how many days a pack should last. The agent watches how many packs are added, then watches the next time packs of that product are added, and finds the average.

Weekends stay in the calendar at a lower weight.

1. The Office Manager counts the packs on the shelf. Later counts correct the figure.
2. Each purchase is entered as packs and a price per pack. The Office Manager can attach a receipt, and the receipt is optional.
3. Burn rate = packs added in the months on record, up to the trailing three calendar months, ÷ effective days in those months. This starts only after two calendar months of purchase data.
4. On-hand = last count + packs added since the count - burn rate × effective days since the count.
5. The expected date is the day that quantity reaches the reorder level, walked with the same weights. The reorder level is zero until the Office Manager sets another level for that product.

Monday to Friday each count as one effective day. Saturday and Sunday each count as 0.2. The Super Admin can change 0.2 for the company. Once a product has at least two calendar months of purchase data, the lookback is those months, up to the trailing three. The Super Admin can change that window. Below two months, no burn rate and no forecast are shown.

Across the lookback, packs added stand for packs used. When the office is building a reserve, or a count shows the shelf differs from the projection, the Office Manager records a count and the expected date continues from that count.

A product with fewer than two calendar months of purchase data shows the status Not enough history. The screen states that the forecast will be calculated once the product has at least two months of data. A product is Due when on-hand is already at the reorder level, or when the expected date falls inside the warning window. The warning window is the next 5 effective days, and the Office Manager can change that number on the product. Every other product with a date is On track.

Worked example: 20 packs of coffee

Figure	Value
Packs added in the month	20
Weekdays in that month	22
Weekend days in that month	8
Effective days	$22 + (8 \times 0.2) = 23.6$
Burn rate	$20 \div 23.6$, rounded to 0.85 packs per effective day
Packs on hand	6
Cover, and the expected date	$6 \div 0.85 = 7.1$ effective days after the day of that on-hand figure

The same rate prices the future. A following month with 23.6 effective days is about 20 packs. From Phase 2 the next-month pantry forecast is this same calculation, not a model call. It runs only after two calendar months of purchase data. It uses the months on record, up to the trailing three, and the effective days in the next calendar month. Projected packs are the burn rate times those effective days. Projected spend is projected packs times the average pack price in those months. The Pantry page shows that figure beside the actual month. Below two months, the page states that the forecast will be calculated once two months of data exist. Phase 1 shows the actual monthly prices only.

6. Phase 2: One dashboard

Phase 2 puts assets, punches, and swag on the dashboard from Phase 1, and opens the assistant. Pantry rows gain a next-month forecast beside the actual spend. The forecast uses the effective days in the next month and appears only after two calendar months of data. There is still one login and one office switcher.

6.1 Asset management

An asset belongs to an office. It has a type, a unique tag, a status of In stock, Assigned, or Retired, and at most one current holder. Laptop and Monitor are the first types. Further types are added in the product, with no code change.

The assets held today, and earlier holders where the dates are known, are loaded from the Excel Intuitive already keeps. The Super Admin or the Office Manager can also enter or correct those rows on screen. When an asset is purchased, the Office Manager can attach a receipt. The receipt is optional, and the asset is saved with or without it. The current holder is the first row of history. Reassigning an asset closes the open row and opens a new one. Retiring an asset keeps the history and removes it from current holdings.

- **Tracked Metrics:** Tag, type, office, status, current holder, every past holder with from-date, to-date, the office, and the person who assigned it, and the receipt when one was attached to the purchase.
- **Dashboard View:** Assets for the selected office, with tag, type, status, holder, and the date the current assignment started. Opening an asset shows the full history. Opening a person shows everything they hold, including swag.
- **Agentic Actions:** The Super Admin, the Office Manager, Admin, and Accounts can ask what a person holds and who holds a tag, and can assign or return an asset in the chat or on screen. The write is stored only after they confirm the summary.

6.2 Punch in and out

Punches come from the biometric device already used at the office. Each office is connected to the device at that office. A punch is matched on the biometric identifier stored on the person, and is kept as in-time, out-time, date, and office. Hours are out-time minus in-time. A day with an in-time and no out-time is shown as a missing out-punch. History remains available by person and by date.

Punch times on the dashboard are the times received from the device. Phase 1 does not depend on the device. Assets, swag, and the assistant do not wait for it. The punch section of Phase 2 starts once the device and the feed are named. That open point is in section 14.

- **Tracked Metrics:** In-time, out-time, hours, missing out-punch, office, person, and history.
- **Dashboard View:** For the selected office and day: who has punched in, in-time, out-time, hours, and any missing out-punch. A person's history opens from the row. Accounts does not see this section.

6.3 Swag stock

Swag is stock by office, separate from the pantry. T-shirt, with a size, and Kit are the first items. The Office Manager can add items. When swag is purchased, the Office Manager can attach a receipt. The receipt is optional, and the purchase is saved with or without it. Issuing an item reduces the quantity on hand and opens a holding on the person. Taking it back increases the quantity and

closes the holding. Campus drives do not issue swag, kits, or gifts, and they do not reduce this stock. Earlier swag issues are loaded from the Excel Intuitive already keeps. The Super Admin or the Office Manager can add or correct a row after that load.

- **Tracked Metrics:** Item, size where it applies, office, quantity on hand, open holdings, and the receipt when one was attached to the purchase.
- **Dashboard View:** Stock for the selected office, and the people each item is currently with.
- **Agentic Actions:** The assistant lists a t-shirt or a kit in the same answer as a laptop. The Super Admin, the Office Manager, Admin, and Accounts can issue or take back swag in the chat or on screen after confirming the summary.

6.4 Agentic assistant

The assistant sits on the dashboard. It is the chatbot for the Super Admin, the Office Manager, Admin, and Accounts. It answers from the records in this agent, in plain language. If the person, the asset, or the office is ambiguous, it asks which one. It does not write on a guess.

The same people can tell the chatbot to do the work, instead of clicking through the screens. Each write is repeated back and stored only after a yes.

- **Record a purchase:** product, packs, price per pack, office, and a receipt when the person has one. The receipt stays optional.
- **Set a count:** packs on hand for a product at an office.
- **Add or rename a product:** for that office.
- **Assign or return an asset:** a laptop, a monitor, or another tagged item.
- **Issue or take back swag:** a t-shirt of a size, a kit, or another swag item.
- **Update a candidate:** from Phase 3, mark a person from a drive Full-time or Left.

Anyone who can use the chatbot can ask for next month's pantry cost for an office or a product. The chatbot returns the calculation from section 5.2. If the person adds a one-off change in that conversation, for example that the Ahmedabad office will have five extra leave days, the chatbot takes those days out of the effective days and answers with the revised figure. That revised figure is not stored and is not shown on the dashboard.

The user asks	The assistant does
What does this person hold?	Lists each holding: laptop, monitor, t-shirt, kit, or any other assigned item, with the tag or size and the office.
Who has this asset tag?	Names the current holder and the office, and can open the history.
Assign this laptop to this person.	Repeats the asset, the person, and the office. Stores the assignment only after a yes. A return works the same way.
What will coffee cost next month in this office?	Projected packs are the burn rate times the effective days in the next month. Cost is those packs times the average pack price in the lookback. The answer is labelled as a forecast.

The user asks	The assistant does
What did this office spend on pantry products last month?	Returns the monthly product prices and the office total from the restock lines.

From Phase 3 the same assistant also answers which institute has the highest conversion, and who from a named drive became full-time. The forecast also appears on the pantry screen, next to the actual month, so Accounts can read it without opening the chat.

7. Phase 3: Campus drives

Phase 3 tracks the institutes Intuitive takes interns from, the drives at those institutes, and which interns later become full-time. It is how Intuitive sees where the stronger candidates come from. It is added to the same dashboard.

A drive is an institute, a date, and the hiring office. Candidates on that drive start as interns. Status then becomes Full-time or Left, and the date of that change is stored. When someone becomes full-time, the candidate can be linked to their person record, so later holdings and punches refer to the same person. Drives and candidates are loaded from the Excel Intuitive already keeps. The Super Admin or the Office Manager can add or correct a row after that load.

- **Tracked Metrics:** Institute, drive date, hiring office, candidate name, status (Intern, Full-time, or Left), intern start, full-time date, left date, and the link to the person record when they join.
- **Conversion:** Full-time count ÷ intern count, for an institute and again for a single drive. The screen shows the percent and both counts. Institutes are listed with the highest conversion first. A small intake stays visible as a small intake because the counts sit beside the percent.
- **Dashboard View:** Institutes ranked by conversion; a drive with its date, office, and candidates; and the names of the people from that drive who were hired full-time later. Filters are hiring office and year.
- **Agentic Actions:** The Super Admin, the Office Manager, Admin, and Accounts can ask which institute leads on conversion, who from a drive is now full-time, and can mark a candidate Full-time or Left after confirming the summary.

A campus drive records candidates and outcomes. Kits, gifts, and other stock are not part of this phase.

8. Interactive dashboard

There is one web dashboard. The office switcher and the month control are always on it. The top of the dashboard shows pantry spend for the selected office and month, and the next-month forecast when two months of data exist. The Super Admin has an All offices view for spend and for conversion. Everyone else sees the offices granted to them.

Section	When it appears	What it is for
Pantry	Phase 1	Products, monthly prices, on-hand, expected date, status. The forecast column arrives in Phase 2, after two calendar months of data, as a calculation from the burn rate and past pack prices.
Assets	Phase 2	Current holdings and the history of each asset.
Punch	Phase 2	The day's punches and a person's history. Hidden from Accounts.
Swag	Phase 2	Stock by item and size, and who it was issued to.
Campus	Phase 3	Institutes, drives, candidates, and conversion.
Assistant	Phase 2	The chatbot for the Super Admin, the Office Manager, Admin, and Accounts. Campus questions and actions start in Phase 3.

From a company total the user can open an office. From an office they can open a product, a person, or an institute. From a person they can see holdings. From an institute they can see drives and candidates. A new office shows the five products, zero stock, and Not enough history until restocks exist. Each purchase, receipt, count, assignment, swag issue, and candidate update stores the person who made it and the time.

9. Outside this scope

- **Payroll and personnel files.** Salary, tax, GST, invoices, leave balances, and rosters.
- **Automatic buying.** Vendor records, and any automatic order when a product is Due.
- **The biometric device.** Buying, installing, or maintaining the device. This agent receives punches from the device Intuitive already uses.
- **The Compliance and Governance platform.** Meetings, policy, training, email, and access reviews remain in that platform.
- **A late-arrival rule.** The punch screen shows times, hours, and a missing out-punch.
- **A chatbot for every employee.** The Super Admin, the Office Manager, Admin, and Accounts use the chatbot. Other employees do not.
- **Recruiting workflow.** Job posts, interview plans, and offer letters.
- **Campus giveaways.** Kits, gifts, or any stock handed out at a drive.
- **A shared stock bin.** Offices are not merged into one pantry or one asset cupboard. Combined figures are sums.

10. Assumptions

#	Assumption
1	Amounts are in Indian rupees, and dates are India dates.
2	Saturday and Sunday are the off days. Each counts as 0.2 of a day unless the Super Admin changes that weight. Monday to Friday count as 1.
3	The forecast waits until a product has two calendar months of purchase data. After that, the lookback is the months on record, up to the trailing three, unless the Super Admin changes the window.

#	Assumption
4	The warning window is 5 effective days, and the reorder level is zero, until the Office Manager changes them on that product.
5	Packs added over the lookback stand for packs used. A physical count replaces the projected on-hand from that day.
6	The Office Manager of an office is that office's HR, named by the Super Admin.
7	The Super Admin, the Office Manager, Admin, and Accounts may assign assets and swag on screen and in the chatbot. A write in the chatbot is stored only after confirmation.
8	Each person carries the identifier the biometric device at their office already uses.
9	People sign in with the company account used for Intuitive internal tools.
10	A forecast is a projection from the burn rate and past pack prices. The monthly product price is the actual spend.

11. Risks and dependencies

These conditions can make a figure or a screen wrong even when the build matches this scope.

- **Packs bought stand for packs used.** A bulk buy, a missed purchase line, or stock that is wasted moves the burn rate, the expected date, and the next-month forecast. A physical count corrects on-hand. Until a product has two calendar months of purchases, the screen stays on Not enough history.
- **One weekend weight for every office.** Saturday and Sunday count as 0.2 unless the Super Admin changes that single company number. An office that is fully shut, or one that is busy on the weekend, will not match the shelf until someone records a count.
- **A weekday holiday counts as a full effective day.** The pantry calculation treats Monday to Friday as 1. Support hours skip Intuitive holidays. If the office is empty on a holiday, the expected date and the forecast run ahead of the shelf.
- **A chat change stays in that reply.** Extra leave days given in chat, such as five days at Ahmedabad, change that answer only. The pantry screen and the spend line at the top of the dashboard keep the calendar forecast.
- **A confirmed chat write is stored as entered.** The assistant repeats the purchase, count, assignment, swag issue, or candidate status and saves it after a yes. A yes on the wrong person, size, or office is the record.
- **Sign-in depends on the existing company account.** If that account is unavailable, this dashboard cannot be opened. Restoring the company account sits outside this agent.
- **Punches wait on the device feed.** The punch section starts when the device and the feed in section 14 are named, and when each person record carries that device identifier. A missing or mismatched identifier shows the wrong time or a missing punch. Pantry, assets, swag, and the assistant do not wait on this.

12. Acceptance

A phase is accepted when the rows below are true in a review with Intuitive, on at least two offices, using the worked rules in this document.

Phase	Accepted when
Phase 1	A second office can be added and keeps its own stock and prices. A new office opens with Coffee, Milk, Sugar, Tea, and Sticks, and the Office Manager can add another product. A restock stores the date, the packs, and the price per pack, and the month total includes that line. The expected date follows section 5.2, with Saturday and Sunday at 0.2. Fewer than two calendar months of data shows Not enough history and states that the forecast waits for two months. The month can be downloaded. A pantry purchase can be saved with a receipt or without one.
Phase 2	Reassigning an asset keeps the previous holder and dates. An asset purchase and a swag purchase can each be saved with a receipt or without one. Issuing a t-shirt or a kit reduces stock and shows on the person's holdings. The assistant answers a holding question, and stores an assignment only after confirmation. The pantry shows a next-month forecast beside actual spend after two calendar months of data, using the effective days in the next month. Pantry, assets, swag, and the assistant are sections of the same dashboard. Punches from the office device show in-time, out-time, hours, and a missing out-punch, once the feed in section 14 is connected. Accounts does not see punches. Earlier asset holders and earlier swag issues are loaded from the Excel Intuitive already keeps.
Phase 3	A drive stores the institute, the date, the hiring office, and the candidates. A candidate can be marked Full-time or Left with a date. Each institute shows conversion as a percent and as both counts, highest conversion first. The drive lists who was hired full-time later. The assistant can answer the leading institute and the full-time names from a drive. Campus does not change swag stock. Drives and candidates are loaded from the Excel Intuitive already keeps.

13. Service level

The service level applies in office hours: Monday to Friday, 09:00 to 18:00 IST, excluding Intuitive holidays. Hours outside that window do not count toward availability or support.

Availability in a calendar month is 99.5 percent of those office hours. In a month of about 22 working days, that is about 1 hour of downtime inside office hours.

A dashboard page loads with a p95 under 2 seconds (2,000 ms). Saving a purchase, a count, or an assignment completes with a p95 under 1 second (1,000 ms). A chatbot reply is back with a p95 under 8 seconds.

- **Dashboard down for an office:** reply within 1 office hour, restored within 4 office hours.
- **One section failing:** the rest of the dashboard still works. Reply within 4 office hours, restored within 1 business day.
- **A wrong figure, or one person unable to sign in:** reply within 1 business day, fixed within 3 business days.

The remedy is to restore the service. The dashboard is one shared system. People sign in with the company account already used for Intuitive internal tools. A model is called only when someone asks the chatbot. The forecast figure on the Pantry page is a calculation, so opening that page does not call a model.

14. Open point

The biometric device is already in use, and the make of that device and the way each office sends punches are still to be confirmed. A file, a database, or a vendor feed are all acceptable provided the punch carries the person's device identifier, the direction, and the time. Phase 1 is independent of this. Assets, swag, and the assistant in Phase 2 are independent of it. The punch section starts when the device and the feed are named. Asset and swag purchases store an optional receipt. They do not store a price, and this scope has no forward view of asset or swag spend. Intuitive is asked to confirm whether a price should be recorded on those purchases, and whether a forward view should then appear on the existing Asset and Swag pages.
